owner wanting Dr. Wallace to View...Ofa on hips and elbows...also please do not charge owner ...charge clinic...thank you

The report:

282512 KW/lb

Seven digitalized radiographic images containing projections of the pelvis and elbows were submitted for evaluation. The radiographs are dated 08/22/14.

Radiographic Findings:

On the hip extended view both femoral heads are located in their respective acetabula and are congruous with the acetabular rims.

Greater than 50% of the left femoral head and slightly less than 40% of the right femoral head are located medial to the dorsal acetabular rims.

No osteophyte formation is present on the femoral necks or acetabula.

On the distracted view there is a slight widening of both coxofemoral joints medially; however, approximately 30% of the right femoral head and 40% of the left femoral head remain within the acetabula.

No osteophyte formation present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation.

Submitted Date:	8/21/2014 3:39:09PM
Completed Date:	8/22/2014 4:09:45PM

No sclerosis is associated with the ulnar notches.

Both medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not identified.

Radiologic Diagnosis: Normal pelvis and elbows.

Comments: Radiographic changes to suggest elbow or hip dysplasia are not present. Based on the OFA scheme evaluating hips, the hips would be rated as good in conformation. If an OFA number is desired radiographs will need to be submitted to OFA for evaluation.

Consulting Radiologist:

Dr. Kent Wallace, DVM, Ms, DACVR
